

Close the cycle, from request to issued ticket

What testing the first delivery showed, and what the next week fixes

Version 3.1
August 2026
For approval

DURATION	ITEMS	DAY-2 MILESTONE	OUTCOME
1 week	26 requirements	Email notifications live	Ticket in the customer's hands

1 Why this sprint was rewritten

The original Sprint 2 was about data quality — live updates, airport search, dial codes. Useful work, but none of it closes a sale.

Testing the first delivery showed the real gap: **the cycle does not reach the end**. A request arrives and a proposal can be created, but the customer is never told, the payment proof cannot be opened, and there is no issued ticket at the other side.

So this week has one job, and everything that does not serve it moved to Sprint 3 or 4:

1 Request customer submits	2 Proposal agent creates and sends	3 Choice customer picks	4 Payment proof validated	5 Ticket PDF in the link
--	--	---	---	--

DAY 2 · FIRST MILESTONE

Email notifications live and verifiable

Notifications are the spine of the flow. Without them the customer does not know a proposal exists, and the team does not know a request arrived. They ship first.

- **Customer is emailed** the moment they submit a request, with their reference and expected response time
- **WeeFly is alerted** of every new request, by email to the general address **and** by WhatsApp
- **Customer is notified when the proposal is published**, and that message carries their personal link

"Live and functional" means more than the code sending mail. The sending domain must be authenticated so messages reach the inbox and not the spam folder, and every send must be recorded on the case with its delivery state. Without that record the mail goes out and nobody knows whether it arrived.

2 What gets delivered

Notifications

ITEM	BUSINESS EFFECT	COMPLEXITY
Customer emailed on submission	Confidence from minute one	LOW
WeeFly alerted of every new request, email and WhatsApp	No request goes unseen	MEDIUM
Customer notified when the proposal is published, carrying their personal link	Faster decisions	MEDIUM
Customer notified at every step and every revision	Fewer "any news?" calls	MEDIUM
Agent notified of every customer action	Nothing waits unnoticed	LOW
Sending infrastructure with delivery logging	Proof that messages arrive	MEDIUM
Notify customer action, for airline schedule changes	Concierge service, recorded	LOW

Why airline changes stay manual

Airlines tell WeeFly about schedule changes and cancellations by email or through the reservation system. A person decides what to pass on and how to word it. An automatic "your flight has changed" built on that data would be guesswork; a concierge relaying it with context and options is the service being sold. So the system provides the action, and the agent writes the message — which is then recorded on the case with author and time.

Customer side

ITEM	BUSINESS EFFECT	COMPLEXITY
Summary screen before submitting, with a special requests field	Right quote first time	LOW
Request summary shown above the progress tracker	Clearer on return	LOW
Ticket in the link: PDF to download and a digital version on screen	Cycle closed	MEDIUM

The most valuable field in this sprint

The **special requests** box on the summary screen. It is where "don't arrive at night", "travelling with my mother who needs a wheelchair" and "I must be in Lisbon before 2 pm" go. No structured form captures that. It appears in the backoffice right beside the request, so the agent reads it before quoting — which is the difference between a quote the customer accepts and one they argue with.

Backoffice

ITEM	BUSINESS EFFECT	COMPLEXITY
Dates suggested, not locked. Changing them requires a justification	Flexibility with accountability	LOW
Case header and live bar stay visible in every screen	Never lost in the flow	MEDIUM
Airport autocomplete showing RAK – Marraquexe	Faster, no typos	LOW
Missing fields listed at the top and highlighted in place	Errors found in seconds	LOW
Dates pre-filled when creating a proposal	Less typing	LOW
Simplified price: per passenger plus WeeFly service	Faster quotes, clearer to the customer	MEDIUM
Seller list read from the system users	Ready for the team to grow	LOW
Flight options frozen once payment starts	No change after a price is agreed	LOW
Fix: payment proof cannot be opened	Unblocks issuance	LOW
Rename Compose proposals to Create proposal	Plainer language	LOW

The blocking fix

The payment proof uploaded by the customer **cannot be opened in the backoffice**. That stops payment validation, which stops issuance — it breaks the exact cycle this sprint exists to close. It is a small fix and it comes early, right after the notifications.

How the price works

The proposal carries two figures, and the customer sees both.

Total = (price per passenger × number of passengers) + WeeFly service

Price per passenger	Typed by the agent. The final airline price, taxes already included. No separate airport tax line anywhere
WeeFly service	Per booking, not per passenger. Pre-filled at 20 in the case currency and editable, so the agent starts from a value instead of an empty field
Total	Calculated by the system, never typed
What the customer sees	Two lines and the total: Price 566 € + WeeFly service 20 € = 586 €

The two visible lines exist so the customer never has to ask why the total is 586 and not 566.

Issuance and the final ticket

ITEM	BUSINESS EFFECT	COMPLEXITY
Issuance screen with validation of ticket numbers and required fields	No wrong tickets	MEDIUM
Ticket PDF generated from the approved template	Professional delivery	MEDIUM
Delivered by email and permanently available in the customer's link	Customer always has it	MEDIUM
How to read your ticket guide alongside	Fewer support questions	LOW

The ticket is already designed and approved

Three pages: itinerary with each passenger's ticket number, seat and baggage on every flight · baggage, check-in times and a ten-step trip preparation guide · services, contacts and legal notices. No prices anywhere on the document. This sprint implements it — there is no new design work in it.

3 What moved out, and where it went

GOES TO	ITEMS
Sprint 3	Roles and permissions · user profile screen · live updating without reload · background saving without flicker · advanced airport search · backoffice menu structure, live bar, dashboard · internal chat
Sprint 4	Multi-city requests · full dial codes · finalised tickets and archive · pasting ticket data to fill fields · everything on the premium private link

4 Decisions confirmed

Internal chat	Runs alongside WhatsApp. WhatsApp stays the customer's channel; the case notes are the record the company owns. Bringing WhatsApp inside the system is a later phase, not a dependency
Changing dates	Any agent may propose new dates. No approval gate — the controls are the mandatory justification, the revision, the notification and the log. Nobody can do it quietly
Airline changes	Relayed manually by an agent, never sent automatically
Airport data	The dataset already exists and is reused, not rebuilt
WeeFly service fee	Per booking, pre-filled at 20, editable, shown to the customer as its own line

5 Still to decide

#	QUESTION	AFFECTS
Q3	Who takes a request that arrives with no seller attached, and does the person who claims it earn the commission?	How the team works. Open queue ships by default
Q4	How long are conversations, documents and the activity log kept?	Sprint 3
Q6	How many bookings a year define Diamond and Platinum?	Sprint 4
Q7	Should amounts follow the customer's language or the currency?	Number formatting
Q8	What else belongs to Concierge besides the Price Checker?	Sprint 3 menu structure

What changes at the end of this week

A customer submits a request and is told immediately. The team is alerted the moment it arrives. The agent creates a proposal in a short form with the dates already filled and the fee already suggested, and the customer is notified with their own personal link. Payment proof can be opened and validated. And the ticket is issued as a PDF that arrives by email and stays permanently in the customer's link, alongside a guide explaining how to read it.

That is the complete cycle, end to end, inside the system. Everything after this week is refinement.
