

Sprint Plan

Four weeks of development, organised by the value each week delivers

Version 3.0

August 2026

For approval

DURATION	SCOPE	FIRST MILESTONE	STATUS
4 sprints of 1 week	68 requirements	Day 2	Awaiting approval

1 How this plan is built

The work is not organised by module. It is organised by **the value each week returns to the business**. Week one makes the team faster and the money collectable. Week two removes the errors that cost real money. Week three makes the tool navigable. Week four opens the premium channel.

This order is deliberate. Building module by module means the benefit only arrives at the end. Building by value means **the operation improves from day two**, and each week after that pays for the next.

COMPLEXITY	WHAT IT MEANS
LOW	A contained change, in one place
MEDIUM	Touches several parts of the system
HIGH	Needs a decision or new groundwork before it can be built

DAY 2 · FIRST MILESTONE

The operation can quote, charge and get paid

Before anything else, the priority is a working commercial cycle. By the end of day two the team can receive a request, produce a quote in a fraction of the current time, send a payment link and collect the money. Nothing in this milestone is cosmetic.

- **The request form works correctly.** Today the three selectors at the top are broken, which means every request arrives with default values. A family of four in business class reaches the team as one adult in economy. The request is not blocked — it is silently wrong, and the quote goes out for the wrong trip
- **Five payment methods available.** Vinti4/SISP, Stripe, Revolut, Instapay and PayPal, in every market. This is how the money arrives
- **The payment link is created at the right moment** — after the customer chooses and all passenger details are in. A link created earlier can carry the wrong amount
- **A shorter quote form.** The team fills in only what the customer needs to decide, not the full ticket
- **Nothing is typed twice.** What the customer entered arrives already filled in
- **Dates are validated** and the price validity is timestamped, so the one-hour promise is verifiable

2 The four sprints

S1 Respond faster and get paid

Week 1

Value: cut the time between a customer's request and a quote they can pay, and make sure the money can be collected. This is the week the team feels immediately.

DELIVERED

ITEM	BUSINESS EFFECT	COMPLEXITY
Fix the request form selectors	Correct requests	LOW
Five payment methods, all markets	Money collected	MEDIUM
Payment link created at the correct step	Right amount charged	MEDIUM
Shorter quote form	Faster quoting	MEDIUM
Reuse of everything the customer entered	Faster quoting	MEDIUM
Route and dates locked, changes need a reason	Fewer disputes	MEDIUM
Date validation and price validity timestamp	Credible offers	LOW
Baggage counters, times and price on the quote	Complete offers	LOW
WhatsApp contact on every screen of a case	Faster answers	LOW
User menu with profile, settings and log out	Basic usability	LOW

S2 Stop errors and losses

Week 2

Value: remove the causes of wrong data, requests nobody saw, and cases that die without being closed. Every item here prevents a cost that is being paid today.

DELIVERED

ITEM	BUSINESS EFFECT	COMPLEXITY
Live updating: a new request appears without reloading	No request goes unseen	MEDIUM
Background saving with no screen flicker	Nothing lost while typing	MEDIUM
Complete countries, cities and airport codes	Serves every route	MEDIUM
Multi-city requests, up to four flights	Feature actually usable	LOW
Complete international dial codes	Serves the diaspora	LOW
Airline logos in quotes and at issuance	Professional presentation	LOW
Finalised tickets: complete, cancelled, expired, archived	Cases get closed	MEDIUM
Paste ticket data to fill the fields automatically	Faster issuance, fewer typos	HIGH

One safeguard on the automatic filling

Pasting ticket data to fill the fields saves real time, but the result must **never be saved without the agent confirming it**. A tool that is right ninety-five percent of the time produces one wrong ticket in twenty — and a wrong ticket costs a full reissue. It fills the fields; a person still approves them.

S3 Make the backoffice navigable

Week 3

Value: the team always knows where it is, what it can do there, and what is happening across the platform. This is the week that reduces training time and supervision effort.

DELIVERED

ITEM	BUSINESS EFFECT	COMPLEXITY
New menu structure: Dashboard, Price Checker, My space, Employees	Clear orientation	MEDIUM
Individual accounts, with open sessions visible to the admin	Accountability	MEDIUM
Live bar on every screen: activity, who is online, change log	Full supervision	HIGH
Standard page header with breadcrumbs and a context note	Shorter learning curve	MEDIUM
Dashboard with metrics and filters by day, week, month and year	Decisions on data	HIGH
Cases claimed move to the agent's own space	Clear ownership	MEDIUM
English and Portuguese, set once in settings	Team flexibility	LOW
Internal chat: with the customer and between colleagues, tied to the case	Nothing lost when staff change	HIGH
Link preview on WhatsApp with logo and contextual title	Credibility at first contact	MEDIUM

Why the internal chat matters more than it looks

Today the negotiation happens on WhatsApp, on the seller's own phone. If that person leaves, the history leaves with them. Tying the conversation to the case means **the company owns its own commercial relationships**, not the individual. It is also what justifies changing a customer's dates: no record, no justification.

S4 Premium customer and private link

Week 4

Value: open a channel for known customers where the experience is faster because nothing is asked twice. This is the week that builds retention rather than efficiency.

DELIVERED

ITEM	BUSINESS EFFECT	COMPLEXITY
Registration that turns the open link into a personal one	Known customers	MEDIUM
Customisable link: image, title and message	Personal first contact	MEDIUM
Private link that never expires, working as the customer's own app	Repeat business	MEDIUM
Contact step removed for known customers	Fewer steps to buy	LOW
Greeting by name, changing headline, account tier	Premium feel	LOW
Background image of the departure and destination city	Emotional connection	MEDIUM
Review screen before submitting, with special requests	Better quotes first time	LOW
Shortcut to valid tickets, always available	Reason to come back	LOW
Email and WhatsApp notifications at every step	Fewer status calls	MEDIUM
VIP customers menu in the backoffice	Commercial management	MEDIUM

The single most valuable field in this sprint

The **special requests** box on the review screen. It is where "don't arrive at night", "travelling with my mother who needs a wheelchair" and "I must be in Lisbon before 2 pm" go. No structured form captures that, and it is precisely what makes a concierge worth more than a booking website. It appears in the backoffice right beside the request, where the agent reads it before quoting.

3 What is deliberately left for later

These were raised and recorded. They are not in this plan because each needs a decision before it can be built, and none of them blocks the operation.

ITEM	WHY IT WAITS
Sharing and rewards game	Needs a commercial model first
Wallet with a balance	See the note below
Commissions: referrals, affiliate codes, agents booking for others	Needs commission rules defined
Accommodation and car at the destination	Already designed, waiting for the partner supply
Making the waiting screen entertaining	Concept stage

On the wallet balance

A balance in euros or dollars shown on a screen is a promise. From the moment the customer sees it, they expect to spend it. If it can be redeemed against a future purchase, it is not a game mechanic — it is a **financial liability with accounting consequences**. The decision taken is that it appears on no screen in this phase. Better to show nothing than to show it and take it back.

4 Decisions needed from you

Eight questions. The first three affect what gets built in sprints 3 and 4; the rest can be answered as the work progresses.

#	QUESTION	AFFECTS
Q1	Does the internal chat replace WhatsApp, or run alongside it?	Sprint 3 scope
Q2	Who may propose new dates to a customer — any agent, or a supervisor only?	Permissions
Q3	Who takes a request that arrives with no seller attached?	How the team works
Q4	How long are conversations, documents and the activity log kept?	Storage and data protection
Q5	Is the customer notified of every change, or only the important ones?	Notification volume
Q6	How many bookings a year define Diamond and Platinum?	Loyalty tiers
Q7	Should amounts follow the customer's language or the currency?	Number formatting
Q8	What else belongs to Concierge besides the Price Checker?	Menu structure

5 What this plan assumes

Answers within one working day	Validation requests answered quickly. A question left open for three days stops a sprint
Airline logo files	Provided as PNG or SVG with transparent background. The list of airlines is in the development document
Payment provider accounts	Active credentials for Vinti4/SISP, Stripe, Revolut, Instapay and PayPal before sprint 1 closes
City images	20 to 30 licensed images for the private link background, needed before sprint 4
Scope is fixed per sprint	New requests are recorded and enter the following sprint, not the one in progress

What changes for the business at the end of these four weeks

A quote that today takes a long series of manual steps becomes a short form with most fields already filled. Money can be collected through five methods instead of an improvised arrangement. Requests stop being missed. Cases get formally closed instead of drifting. The negotiation history belongs to the company. And known customers get a channel where they never repeat themselves — which is the difference between selling a ticket and keeping a client.
