

Test results and ticket improvements

What the Sprint 3 delivery still gets wrong, and how the final ticket gets better

Version 3.3
September 2026
For approval

CORRECTIONS 22	TICKET IMPROVEMENTS 12	BLOCKING 4 items	DURATION 1 week
-------------------	---------------------------	---------------------	--------------------

1 Where the cycle still breaks

Four problems stop a sale from completing. Everything else in this document is secondary to them.

ID	PROBLEM	WHAT IT MEANS IN PRACTICE	COMPLEXITY
T-17	The payment email does not carry the payment link	The customer cannot pay. They receive an email telling them to pay, with nothing to pay with	MEDIUM
T-04	Issuance has no fields for the return flight	A round trip cannot be issued. Only the outbound can be entered	MEDIUM
T-02	Changing the chosen option leads to a dead end	The customer goes back to the offers and can no longer select any of them	MEDIUM
T-08	The chosen language is ignored	The customer chose Portuguese and received everything in English	MEDIUM

What the ×5 and ×22 mean — and what they reveal

They are **repetition counters**. The notification list groups identical events and shows how many times each one fired. Grouping is good behaviour. The numbers are not.

0 prazo de pagamento expirou ×22 means the expiry event fired twenty-two times for a single case. **A deadline expires once.** Almost certainly a scheduled job re-emitting the event on every run instead of marking it as already sent.

If those notifications also went out by email or WhatsApp, the customer received twenty-two identical messages. Worth checking today, before anything else. Recorded as T-22.

2 The rest of the corrections

Ownership and seller

ID	CORRECTION	WHY	COMPLEXITY
T-01	Remove entirely the option to quote a case that was not claimed	Two agents on one case	LOW
T-05	On link creation, the seller is automatically the logged-in user. Dropdown removed	One less choice, no mistakes	LOW
T-06	On the proposal, the seller is the logged-in user	Correct attribution	LOW
T-03	Backoffice reacts live to customer actions, with no manual refresh	Team sees changes as they happen	MEDIUM

Proposal content

ID	CORRECTION	WHY	COMPLEXITY
T-09	The customer's special request appears in the Proposals tab	The agent reads it before quoting	LOW
T-10	Baggage and fare conditions attached per flight, not per trip	Fares differ out and back	MEDIUM
T-07	Remove the arrival label from the request, since the request has no arrival date	A label with no data reads as missing information	LOW
T-11	Payment deadline set automatically: send time plus one hour	Nobody has to remember it	LOW
T-21	New filter for closed cases	Finished work leaves the queue	LOW

Why baggage per flight matters more than it sounds

A customer may deliberately fly out with a larger allowance and come back with less, to cut the cost. One value for the whole trip cannot express that — and it is exactly the kind of tailoring a concierge is paid for. This runs through the whole chain: it has to be captured in the proposal, shown to the customer, and printed on the ticket per flight.

Emails and customer screens

ID	CORRECTION	WHY	COMPLEXITY
T-14	Ticket code in the orange band, top right, on every email and every screen	Same place, always	LOW
T-15	First email: correct WeeFly logo	First impression	LOW
T-16	Second email: logo, the date and not only the time , and the note written when dates were changed	A time with no date is unusable	LOW
T-18	Payment screen: a message field to WeeFly, proof upload, and a WhatsApp button	Customer can explain and prove	MEDIUM
T-19	Passport screen: logo, and the phone number opens WhatsApp when tapped	One tap to ask	LOW
T-20	Payment confirmation email: white logo and a link to the ticket	Straight to what they bought	LOW
T-12	The countdown overflows its container on the payment screen	Legibility	LOW
T-13	Countdown always visible, ordered timer, then title, then note	Urgency without hunting for it	LOW

3 Improving the final ticket

Two reference documents informed this: a **Trip.com e-itinerary** and the **WeeFly booking voucher**. Each does something the current template does not.

SOURCE	WHAT IT DOES WELL	WHY IT MATTERS
Trip.com	Baggage stated per segment and per passenger, with exact dimensions	A connection on two carriers means two different allowances
Trip.com	States baggage checked through at each transfer	The most common question at a connection
Trip.com	Separates booking number, e-ticket number and airline reference	Three different codes travellers constantly confuse
WeeFly voucher	Dark masthead with the reference large in orange	Found in one second on a phone
WeeFly voucher	Status band: Booking confirmed and ticketed	The state is legible without reading
WeeFly voucher	Per-segment strip: cabin, cabin bag, checked bag, airline PNR, segment status	Everything a counter agent asks, in one row
WeeFly voucher	Passenger table with type badge and date of birth	Date of birth is what proves the passenger type

The twelve improvements

ID	IMPROVEMENT	EFFECT	COMPLEXITY
TK-01	Dark masthead with the reference large and in orange, top right	Instantly findable	LOW
TK-02	Status band with the case state and the trip type	State legible at a glance	LOW
TK-03	Baggage per segment and per passenger, with maximum dimensions	Correct at every counter	MEDIUM
TK-04	Connections state whether baggage is checked through and whether the terminal changes	Answers the question before it is asked	LOW
TK-05	Three codes clearly separated: WeeFly reference, airline PNR, e-ticket number	Nobody quotes the wrong one	LOW
TK-06	Information strip under every flight	One row, everything asked for	LOW
TK-07	Date of birth in the passenger table	Proves the passenger type	LOW
TK-08	Airline logo per flight, with operating and marketing carrier distinguished	Passenger finds the right desk	LOW
TK-09	Aircraft type per flight	Present in both references, absent in ours	LOW
TK-10	Total duration per direction, including connections	Sets expectations honestly	LOW
TK-11	Scannable code carrying the PNR, ticket number, name and reference	Identify a case in one scan	LOW
TK-12	Fully legible printed in black and white, page one working on its own	Survives an airport printer	LOW

The three codes, and why separating them matters

CODE	USED FOR
WeeFly reference	Talking to WeeFly. The one the customer should quote to us
Airline booking reference, or PNR	Online check-in and anything handled by the airline
E-ticket number	Individual per passenger. What the counter asks for when something goes wrong

Travellers confuse them constantly, and each one is useless in the wrong place. Naming them separately on the document removes an entire category of support calls.

4 Order of work

#	GROUP	REASON
1	Payment link in the email, automatic deadline, duplicate events	The customer cannot pay, has no deadline, and may be receiving duplicate messages
2	Return flight at issuance, the dead end on changing option, quoting without claiming	The cycle cannot close
3	Language, and live reaction in the backoffice	Both affect every screen
4	Proposal content: special request, baggage per flight, seller, labels	The proposal must be right before it goes out
5	Emails and customer screens	What the customer actually receives
6	Layout and filters	Quick wins, safe to leave for last
7	Ticket improvements	Once issuance handles the return flight

TK-03 depends on T-10: the ticket cannot show baggage per flight until the proposal captures it that way.

5 Still to decide

Q3	Who takes a request that arrives with no seller attached, and does the person who claims it earn the commission?
Q4	How long are conversations, documents and the activity log kept?
Q7	Should amounts follow the customer's language or the currency?
–	Confirm whether the duplicated events reached customers by email or WhatsApp

What changes at the end of this week

The customer receives an email they can actually pay from, in the language they chose, with a deadline that sets itself. A round trip can be issued. Going back to change an option works. The team sees every customer action the moment it happens, without reloading anything. And the ticket that arrives carries the baggage allowance for each flight, the three codes clearly separated, and the airline logo on every leg.
